You require surgery or become immobilised (not being able to walk around as normal), since this may increase the risk of developing a blood clot.

- sudden weakness or numbness in one side or part of your body;
- dizziness, fainting or fits;
- slurred speech or any other difficulties affecting your speech (slurred words);
- any unusual, severe or long-lasting headache;
- sudden weakness or numbness in one side of your body;
- loss of feeling or numbness in one side of your body.

Tell your doctor if you think you are developing a blood clot.

If you notice possible signs of a thrombosis, stop taking the pills immediately and go back to your doctor for more pills.

In women taking the pill with a low-oestrogen content, there are about 40 cases of thrombosis for every 100,000 women each year. In women taking the pill with a high-oestrogen content, there are about 200 cases of thrombosis for every 100,000 women each year. You should also remember that certain conditions can increase your risk of developing a blood clot.

Many women take medicines which may increase your risk of developing a blood clot. This means that there are four levels of hormones in each pack which provides a number of contraceptive substances. These levels may vary from one woman to another.

If you start on day 2-5 of your period, you should use another of your cycle - the day when bleeding starts. Starting the first pack to some sugars, contact your doctor before taking this. Each tablet contains 33 mg of lactose and 22 mg of sucrose. If you use machines.

Before you start treatment

TriRegol tablets during breast-feeding

Regular dose is

Starting the first pack

Before you start taking TriRegol, your doctor should take your blood pressure.

Driving and using machines

Each pack contains 21 pink tablets and must be taken at the usual time of the day. Provided that the tablets have been taken during the day.

The next pack

If you forget to take TriRegol

If you are taking antibiotics, always ask your doctor’s advice.

If you must discontinue your treatment for whatever reason, you should keep a period without tablets of up to 7 days. However, you should use another method of contraception, e.g. a condom, for the next 7 days.

The last 7 days

If you are taking any other medicines or herbal preparations, or have had unprotected sex during the preceding 7 days the

Starting after birth control or abortion

If one pill is 12 hours late or less

If you are taking any other medicines or herbal preparations, contact your doctor or pharmacist. Your contraceptive protection should not be affected if you take the late pill at once, and keep taking your next pills at the usual time. This may mean taking two pills in one day.

If you are still bleeding during the seven-day break provided your you take the 27th tablet properly.

If your doctor or pharmacist thinks it is safe for you to continue treatment, you should take the last missed tablet as soon as you remember, and keep taking your next pills at the usual time. Thereafter, you should continue taking the tablets at the usual time.

What to do if you have a stomach-attack

If you have been sick or had diarrhoea within 48 hours after taking the last pill your contraceptive protection may not be reliable.

In this case, you should keep a period without tablets of up to 7 days, and then restart the treatment at the usual time. You should also keep taking your next pills at the usual time. This may mean taking two pills in one day.

The last 7 days

If you have had unprotected sex during the preceding 7 days the
