Read all of this leaflet carefully before you are given this medicine because it contains important information for you.

• Keep this leaflet. You may need to read it again.
• If you have any further questions, ask your doctor or nurse.
• If you get any side effects, talk to your doctor or nurse. This includes any possible side effects not listed in this leaflet. See section 4.

The name of your medicine is "Nicardipine 10 mg/10 ml solution for injection" but in the rest of the leaflet it will be called as 'Nicardipine solution for injection'.

What is this leaflet
1. What Nicardipine solution for injection is and what it is used for
2. What you need to know before you are given Nicardipine solution for injection
3. How Nicardipine solution for injection will be given to you
4. Possible side effects
5. How to store Nicardipine solution for injection
6. Contents of the pack and other information

1. WHAT NICARDIPINE SOLUTION FOR INJECTION IS AND WHAT IT IS USED FOR

Nicardipine solution for injection contains the active substance Nicardipine hydrochloride, which belongs to a group of medicines called calcium channel blockers.

Nicardipine solution for injection is used to treat very severe high blood pressure. It can also be used to control high blood pressure after an operation.

2. WHAT YOU NEED TO KNOW BEFORE YOU ARE GIVEN NICARDIPINE SOLUTION FOR INJECTION

Talk to your doctor or nurse before you are given Nicardipine solution for injection:

• If you have heart failure
• If you have angina
• If your liver is not working properly, or you have had liver disease in the past
• If you have high pressure in the brain
• If you have suffered a recent stroke
• If you are taking beta-blockers
• If you are pregnant
• If you are under 18 years of age
• If you have been told by your doctor that you have an intolerance to some sugars.

Warnings and precautions

Tell your doctor or nurse before you are given Nicardipine solution for injection:

• If you are allergic to Nicardipine or any of the other ingredients of this medicine (listed in section 6)
• If you have chest pain
• If your high blood pressure is because of narrowing of a heart valve or other defects in the heart
• If you have had a heart attack in the last eight days
• If you have been told by your doctor that you have an intolerance to some sugars.

Other medicines and Nicardipine solution for injection

Tell your doctor if you are taking, have recently taken, or might take any other medicines. This includes medicines obtained without a prescription and herbal medicines. This is because Nicardipine solution for injection can affect the way some other medicines work. Also, some other medicines can affect the way Nicardipine solution for injection works.

In particular, tell your doctor if you are taking any of the following medicines:

• Dantrolene (used to treat long-term muscle stiffness)
• Beta-blockers (used to treat high blood pressure and heart conditions) such as propranolol, atenolol and metoprolol
• Medicines used to control seizures, such as carbamazepine, phenobarbitone, primidone and phenytoin
• Baclofen (used to treat muscle spasms)
• Itraconazole (used to treat certain types of fungal infection)
• Rifampicin (used to treat tuberculosis and certain other types of infection)
• Alpha-blockers (used to treat high blood pressure, or prostate problems in men) such as doxazosin, prazosin and terazosin
• Any other medicine for high blood pressure
• Cimetidine (to treat indigestion or stomach ulcers)
• Droxin (used for heart conditions)
• Amifostine (used to protect against the harmful effects of certain cancer treatments)
• Medicines to treat depression, anxiety or other mental health problems
• Strong painkillings medicines like morphine or codeine
• Medicines used to treat inflammation such as steroids and tetracsoacide
• Magnesium injection (used to treat severe high blood pressure in pregnancy).

If you are having an operation, your anaesthetist will need to know which other medicines you are taking, as some of these can affect the way Nicardipine solution for injection works.

3. HOW NICARDIPINE SOLUTION FOR INJECTION WILL BE GIVEN TO YOU

The name of your medicine is "Nicardipine 10 mg/10 ml solution for injection" but in the rest of the leaflet it will be called as 'Nicardipine solution for injection'.

Posology and method of administration:

Nicardipine solution for injection should be administered by continuous intravenous infusion only. It should only be administered by specialists in well controlled environments, such as hospitals and intensive care units, with continuous monitoring of blood pressure. The speed of administration must be accurately controlled by the use of an electronic syringe driver or a volumetric pump. Blood pressure and heart rate must be monitored at least every 5 minutes during the infusion, and then until vital signs are stable, but at least for 12 hours after the end of the administration of Nicardipine solution for injection.

The antihypertensive effect will depend on the administered dose. The dosage regimen to achieve the desired blood pressure can vary depending on the targeted blood pressure, the response of the patient, and the age or status of the patient.

Unless given by a central venous line, dilute to a concentration of 0.1 - 0.2 mg/ml before use.

Adults:

Initial dose: Treatment should start with the continuous administration of Nicardipine at a rate of 3-5 mg/h for 15 minutes. Rates can be increased by increments of 0.5 or 1 mg every 15 minutes. The infusion rate should not exceed 15 mg/h.

Maintenance dose: When the target pressure is reached, the dose should be reduced progressively, usually to between 2 and 4 mg/h, to maintain the therapeutic efficacy.

Elderly:

Elderly patients may be more sensitive to Nicardipine effects because of impaired renal and/or hepatic function. It is recommended to provide a continuous infusion of Nicardipine starting at the dose of 1 to 5 mg/h, depending on the blood pressure and clinical situation. After 30 minutes, depending on the effect observed, the rate should be increased or decreased by increments of 0.5 mg/h. The rate should not exceed 15 mg/h.

Paediatric population:

Nicardipine solution for injection, safety and efficacy has not been established in low birth weight infants, newborns, nursing infants, infants and children.

Nicardipine should only be used for life-threatening hypertension in paediatric intensive care settings or post-operative contexts.

Initial dose: In case of emergency, a starting dose of 0.5 to 6 mcg/kg/min is recommended.

Maintenance dose: The maintenance dosage of 1 to 4 mcg/kg/min is recommended.

Nicardipine should be used with particular caution in children with renal impairment. In this case, only the lowest posology should be used.

continued overleaf
Nicardipine solution for injection with food and drink
Do not drink grapefruit juice or eat grapefruit whilst using this medication as it may increase blood levels of Nicardipine.

Pregnancy and breastfeeding
If you are pregnant or breastfeeding, think you may be pregnant or are planning to have a baby, ask your doctor for advice before you are given this medicine.

Pregnancy
Nicardipine solution for injection should be used with caution in women in the third trimester of pregnancy as it could interfere with the spontaneous induction on labour.

Nicardipine solution for injection should not be used if you are having multiple children (twins or more) or if you have any issues with your heart except if no other suitable option is available.

Breast-feeding
Nicardipine solution for injection should not be used during breastfeeding.

Driving and using machines
Nicardipine solution for injection does not affect your ability to drive and use machines.

Nicardipine solution for injection contains sorbitol
This medicine contains sorbitol. If you have been told by your doctor that you have an intolerance to some sugars, contact your doctor before you are given this medicinal product.

3. HOW NICARDIPINE SOLUTION FOR INJECTION WILL BE GIVEN TO YOU

This medicine will be given to you in hospital.
Your doctor will decide on the amount of Nicardipine solution for injection you will be given. This will depend on how much and how fast they want to reduce your blood pressure.
The medicine will be injected slowly into a vein. Your blood pressure will be taken whilst you are receiving treatment and the dose adjusted to make sure your blood pressure fall to normal levels.
Nicardipine solution for injection will be given to you by a doctor, who will ensure that the correct dose is given for your condition. If you have any concerns tell your doctor or nurse.

If you have any further questions on the use of this medicine, ask your doctor or nurse.

4. POSSIBLE SIDE EFFECTS

Like all medicines, this medicine can cause side effects, although not everybody gets them.
Headache is the most common side effect, which may affect more than 1 in 10 people.

Other side effects include:
Common (may affect up to 1 in 10 people)
• Dizziness
• Swollen legs or ankles
• Increased heart rate, feeling your heart beat (palpitations)
• Low blood pressure, especially on standing up. This may cause dizziness, lightheadedness or fainting
• Feeling sick or being sick
• Flushing of the skin.

Not known (frequency cannot be estimated based on the available data)
• Reduction in blood platelets, which may increase the risk of bleeding or bruising
• Slow heart rhythm
• Chest pain
• Heart problems leading to increased fluid in the lungs and shortness of breath
• Abdominal pain
• Redness of the skin
• Inflammation of the vein where the medicine has been given
• Changes in blood tests of how your liver is working.

Reporting of side effects
If you get any side effects, talk to your doctor or nurse. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via the Yellow Card Scheme at: www.mhra.gov.uk/yellowcard.
By reporting side effects you can help provide more information on the safety of this medicine.

5. HOW TO STORE NICARDIPINE SOLUTION FOR INJECTION

Your hospital will store this medicine appropriately.

6. CONTENTS OF THE PACK AND OTHER INFORMATION

What Nicardipine solution for injection contains
The active substance is Nicardipine. Each Nicardipine solution for injection ampoule contains Nicardipine hydrochloride 10mg/10ml.
The other ingredients are sorbitol, citric acid monohydrate, sodium citrate, hydrochloric acid, sodium hydroxide and water for injections.

What Nicardipine solution for injection looks like and contents of the pack
Nicardipine solution for injection is a clear, pale yellow colored solution. It is available in brown glass ampoules containing 10ml of the solution for injection.
Each pack contains 5, 10 or 50 ampoules. Not all pack sizes may be marketed.

This leaflet was last revised in May 2017.

Pregnancy:
It is recommended to provide a continuous infusion of nicardipine starting at 1 to 5 mg/h, depending on the blood pressure and clinical situation. After 30 minutes, depending on the effect observed, this rate can be increased or decreased by increments of 0.5 mg/h.
Doses higher than 4mg/h are generally not exceeded in the treatment of pre-eclampsia, however the rate should not exceed 15 mg/h. The use of nicardipine for severe pre-eclampsia during the third trimester of pregnancy could potentially produce an undesirable tocolytic effect which could potentially interfere with the spontaneous induction of labour.
Acute pulmonary oedema has been observed when nicardipine has been used as tocolytic during pregnancy, especially in cases of multiple pregnancy (twins or more), with the intravenous route and/or concomitant use of beta-2 agonists. Nicardipine should not be used in multiple pregnancies or in pregnant women with compromised cardio-vascular condition, except if there is no other acceptable alternative.

Hepatic Impairment:
Nicardipine should be used with particular caution in these patients. It is recommended to use the same dose regimens as for elderly patients in patients with impaired liver function or reduced hepatic blood flow.

Renal Impairment:
Nicardipine should be used with particular caution in these patients. It is recommended to use the same dose regimens as for elderly patients in patients with renal impairment.

Incompatibilities:
Nicardipine solution for injection should not be mixed with other medicinal products except those mentioned under posology and method of administration section.
A risk of precipitation exists with products presenting a pH in solution greater than 6. A risk of adsorption of Nicardipine exists on plastic materials in devices for infusion in the presence of saline solutions.

Shelf life:
Before opening: 2 years.
After opening: The physicochemical stability of the undiluted solution or diluted in a solution of 5% dextrose in water in a polypropylene syringe has been demonstrated for 24 hours at temperatures of +25 °C, away from light. Nonetheless, from a microbiological standpoint, the product should be used immediately.
