Other medicines and Risperidone

Tell your doctor or pharmacist if you are taking, have recently taken or might take any other medicines

It is especially important to talk to your doctor or pharmacist if you are taking any of the following:

 Medicines that work on your brain such as to help you calm down (benzodiazepines) or some medicines for pain (opiates). medicines for allerov (some antihistamines), as risperidone may increase the sedative effect of all of these Medicines that may change the electrical activity of your heart. such as medicines for malaria, heart rhythm problems allergies (anti-histamines), some antidepressants or other medicines for mental problems

Medicines that cause a slow heart beat Medicines that cause low blood potassium (such as certain

Medicines to treat raised blood pressure. Risperidone can

 Medicines for Parkinson's disease (such as levodopa) Medicines that increase the activity of the central nervous system (psychostimulants, such as methylphenidate) Water tablets (diuretics) used for heart problems or swelling of parts of your body due to a build up of too much fluid (such as furosemide or chlorothiazide). Risperidone taken by itself or in elderly people with dementia.

The following medicines may reduce the effect of risperidone Rifampicin (a medicine for treating some infections) Carbamazepine, phenytoin (medicines for epilepsy)

If you start or stop taking such medicines you may need a

The following medicines may increase the effect of risperidon Quinidine (used for certain types of heart disease) Antidepressants such as paroxetine, fluoxetine, tricyclic

· Medicines known as beta blockers (used to treat high blood

- Phenothiazines (such as medicines used to treat psychosis or to calm down)
- Cimetidine, ranitidine (blockers of the acidity of stomach) Itraconazole and ketoconazole (medicines for treating fungal infections)
- Certain medicines used in the treatment of HIV/AIDS, such as
- Verapamil, a medicine used to treat high blood pressure and/or abnormal heart rhythm
- Sertraline and fluvoxamine, medicines used to treat depression and other psychiatric disorders

If you start or stop taking such medicines you may need a different dose of risperidone.

If you are not sure if any of the above applies to you, talk to you doctor or pharmacist before using Risperidone

Risperidone with food, drink and alcohol

You can take this medicine with or without food. You should avoid drinking alcohol when taking Risperidone

Pregnancy, breast-feeding and fertility

- If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor or pharmacist for advice before taking this medicine. Your doctor will decide if you can take it.
- with furosemide, may have an increased risk of stroke or death . The following symptoms may occur in newborn babies, of mothers that have used risperidone in the last trimester (last three months of their pregnancy): shaking, muscle stiffness and/or weakness, sleepiness, agitation, breathing problems, and difficulty in feeding. If your baby develops any of these symptoms you may need to contact your doctor.
 - Risperidone can raise your levels of a hormone called "prolactin" that may impact fertility (see Possible side effects).

Driving and using machines

Dizziness, tiredness, and vision problems may occur during treatment with Risperidone. Do not drive or use any tools or machines without talking to your doctor first.

Risperidone contains aspartame (E951) This medicine contains 0.40 mg aspartame in each 0.5 mg

 Your dose may then be adjusted by your doctor depending how you respond to the treatment Most people feel better with daily doses of 4 to 6 mg This total daily dose can be divided into either one or two doses a day. Your doctor will tell you which is the best for you.

Adults

sure.

Elderly people

orodispersible tablets. Aspartame is a source of phenylalanine. It

- · Your dose may then be gradually increased by your doctor to 1 mg to 2 mg twice a day
- Your doctor will tell you which is the best for you.

For the treatment of mania

- Your starting dose will usually be 2 mg once a day
- Your dose may then be gradually adjusted by your doctor
- depending on how you respond to the treatment Most people feel better with doses of 1 to 6 mg once a day

Elderly people

- Your starting dose will usually be 0.5 mg twice a day
- Your dose may then be gradually adjusted by your doctor to 1 mg to 2 mg twice a day depending on how much you respond to the treatment.

For the treatment of long-standing aggression in people with Alzheimer's dementia

Adults (including elderly people)

- Your starting dose will normally be 0.25 mg twice a day
- Your dose may then be gradually adjusted by your doctor depending on how you respond to the treatment
- Most people feel better with 0.5 mg twice a day. Some patients
- may need 1 mg twice a day Treatment duration in patients with Alzheimer's dementia
- should be not more than 6 weeks.

Use in children and adolescents

 Children and adolescents under 18 years old should not be treated with Risperidone for schizophrenia or mania.

For the treatment of conduct disorder

The dose will depend on your child's weight:

For children who weigh less than 50 kg

- The starting dose will normally be 0.25 mg once a day
- The dose may be increased every other day in steps of 0.25 mg per day.
- The usual maintenance dose is 0.25 mg to 0.75 mg once a
- For children who weigh 50 kg or more
- The starting dose will normally be 0.5 mg once a day
- The dose may be increased every other day in steps of 0.5 mg per dav
- The usual maintenance dose is 0.5 mg to 1.5 mg once a day. Treatment duration in patients with conduct disorder should be not more than 6 weeks.

Children under 5 years old should not be treated with Risperidone for conduct disorder.

130 mm ± 0.5 mm

People with kidney or liver problems

Regardless of the disease to be treated, all starting doses and following doses of risperidone should be halved. Dose increases should be slower in these patients.

Risperidone should be used with caution in this patient group.

Method of administration

For oral use

Risperidone orodispersible tablets are fragile. They should not be pushed through the foil in the blister as this will cause damage to the tablet. Remove a tablet from the package as follows

- 1. Hold the blister at the edges and separate one blister cell from the rest of the blister by gently tearing along the perforations around it.
- 2. Pull up the edge of the foil and peel foil off completely.
- 3. Tip the tablet out onto your hand.
- 4. Put the tablet on the tongue as soon as it is removed from the packaging

In a few seconds it begins disintegrating in the mouth and subsequently can be swallowed with or without water. The mouth should be empty before placing the tablet on the tongue.

You can also put the tablet in a full glass or cup of water and drink it straight away.

If you take more Risperidone than you should

- See a doctor right away. Take the medicine pack with you
- In case of overdose you may feel sleepy or tired, or have abnormal body movements, problems standing and walking, feel dizzy due to low blood pressure, or have abnormal heart beats or fits.

If you forget to take Risperidone

• If you forget to take a dose, take it as soon as you remember it. However, if it is almost time for your next dose, skip the

missed dose and continue as usual. If you miss two or more doses, contact your doctor

Do not take a double dose (two doses at the same time) to make up for a forgotten dose.

If you stop taking Risperidone

You should not stop taking this medicine unless told to do so by your doctor. Your symptoms may return. If your doctor decides to stop this medicine, your dose may be decreased gradually over a few davs.

If you have any further questions on the use of this medicine, ask your doctor or pharmacist.

4. Possible side effects

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Tell your doctor immediately if you experience any of the following uncommon side effects (may affect up to 1 in 100 people):

 Have dementia and experience a sudden change in your mental state or sudden weakness or numbness of your face, arms or legs, especially on one side, or slurred speech, even for a short period of time. These may be signs of a stroke

Experience tardive dyskinesia (twitching or jerking movements that you cannot control in your face, tongue, or other parts of vour body). Tell your doctor immediately if you experience involuntary rhythmic movements of the tongue, mouth and face. Withdrawal of risperidone may be needed.

Tell your doctor immediately if you experience any of the following rare side effects (may affect up to 1 in 1000 people):

- Experience blood clots in the veins, especially in the legs (symptoms include swelling, pain, and redness in the leg), which may travel through blood vessels to the lungs causing chest pain and difficulty breathing. If you notice any of these symptoms seek medical advice immediately
- Experience fever, muscle stiffness, sweating or a lowered level of consciousness (a disorder called "Neuroleptic Malignant

- Syndrome"). Immediate medical treatment may be needed
- Are a man and experience prolonged or painful erection. This is called priapism. Immediate medical treatment may be hobdod
- Experience severe allergic reaction characterised by fever, swollen mouth, face, lip or tongue, shortness of breath, itching, skin rash or drop in blood pressure.

The following side effects may happen:

Very common (may affect more than 1 in 10 people): Difficulty falling or staying asleep.

- Parkinsonism: This condition may include: slow or impaired movement, sensation of stiffness or tightness of the muscles (making your movements jerky), and sometimes even a sensation of movement "freezing up" and then restarting. Other signs of parkinsonism include a slow shuffling walk, a tremor while at rest, increased saliva and/or drooling, and a loss of expression on the face
- Feeling sleepy, or less alert. Headache.

direction on fibre

Common (may affect up to 1 in 10 people):

• Pneumonia, Infection of the chest (bronchitis), Common cold symptoms, Sinus infection, Urinary tract infection Ear infection, Feeling like you have the flu.

• Raised levels of a hormone called "prolactin" found in a blood test (which may or may not cause symptoms). Symptoms of high prolactin occur uncommonly and may include in men breast swelling, difficulty in getting or maintaining erections, decreased sexual desire or other sexual dysfunction. In women they may include breast discomfort, leakage of milk from the breasts, missed menstrual periods, or other problems with your cycle or fertility problems.

- Weight gain, Increased appetite, Decreased appetite.
- · Sleep disorder, Irritability, Depression, Anxiety, Restlessness.
- Dystonia: This is a condition involving slow or sustained involuntary contraction of muscles. While it can involve any part of the body (and may result in abnormal posture), dystonia often involves muscles of the face, including abnormal movements of the eyes, mouth, tongue or jaw.

- Dizziness.
- Dyskinesia: This is a condition involving involuntary muscle movements, and can include repetitive, spastic or writhing movements, or twitching,
- Tremor (shaking). · Blurry vision, Eye infection or "pink eye".
- Rapid heart rate, High blood pressure, Shortness of breath.
- Sore throat, Cough, Nosebleeds, Stuffy nose.
- Abdominal pain, Abdominal discomfort, Vomiting, Nausea,
- Constipation, Diarrhoea, Indigestion, Dry mouth, Toothache. · Rash, Skin redness.
- Muscle spasms, Bone or muscle ache, Back pain, Joint pain. · Incontinence (lack of control) of urine.
- Swelling of the body, arms or legs, Fever, Chest pain, Weakness, Fatigue (tiredness), Pain Fall

Uncommon (may affect up to 1 in 100 people):

- Infection of the breathing passages, Bladder infection, Eye infection, Tonsillitis, Fungal infection of the nails, Infection of the skin, An infection confined to a single area of skin or part of the body, Viral infection, Skin inflammation caused by mites.
- Decrease in the type of white blood cells that help to protect you against infection, White blood cell count decreased, Decrease in platelets (blood cells that help you stop bleeding). Anaemia, Decrease in red blood cells, Increase in eosinophils
- (a type of white blood cell) in your blood. Allergic reaction. Diabetes or worsening of diabetes, High blood sugar,
- Excessive drinking of water.
- Weight loss, Loss of appetite resulting in malnutrition and low body weight.
- Increased cholesterol in your blood.
- Elated mood (mania), Confusion, Decreased sexual drive, Nervousness, Nightmares,
- Unresponsive to stimuli, Loss of consciousness, Low level of consciousness
- · Convulsion (fits), Fainting.
- A restless urge to move parts of your body, Balance disorder, Abnormal coordination, Dizziness upon standing, Disturbance

🔺 148 mm ± 0,5 mm

594 mm ± 0,8 mm

- taste, Reduced sensation of skin to pain and touch, A sensation of tingling, pricking, or numbness skin.
- Oversensitivity of the eyes to light, Dry eye, Increased tears, Redness of the eyes.
- Sensation of spinning (vertigo), Ringing in the ears, Ear pain. Atrial fibrillation (an abnormal heart rhythm), An interruption in conduction between the upper and lower parts of the heart, Abnormal electrical conduction of the heart, Prolongation of the QT interval from your heart, Slow heart rate, Abnormal electrical tracing of the heart (electrocardiogram or ECG), A fluttering or pounding feeling in your chest (palpitations). Low blood pressure, Low blood pressure upon standing
- (consequently, some people taking Risperidone may feel faint, dizzy, or may pass out when they stand up or sit up suddenly), Flushing • Pneumonia caused by inhaling food, Lung congestion,
- Congestion of breathing passages, Crackly lung sounds, Wheezing, Voice disorder, Breathing passage disorder. Stomach or intestinal infection. Stool incontinence. Very hard
- stool, Difficulty swallowing, Excessive passing of gas or wind. Hives (or "nettle rash"), Itching, Hair loss, Thickening of skin, Eczema, Dry skin, Skin discoloration, Acne, Flaky, itchy scalp or skin, Skin disorder, Skin lesion.
- An increase of CPK (creatine phosphokinase) in your blood, an enzyme which is sometimes released with muscle breakdown. Abnormal posture, Joint stiffness, Joint swelling, Muscle weakness, Neck pain.
- Frequent passing of urine, Inability to pass urine, Pain when passing urine.
- Erectile dvsfunction. Eiaculation disorder.
- Loss of menstrual periods. Missed menstrual periods or other problems with your cycle (females).
- Development of breasts in men, Leakage of milk from the breasts, Sexual dysfunction, Breast pain, Breast discomfort, Vaginal discharge.
- Swelling of the face, mouth, eyes, or lips.
- · Chills, An increase in body temperature.
- · A change in the way you walk.

- in attention, Problems with speech, Loss or abnormal sense of Feeling thirsty, Feeling unwell, Chest discomfort, Feeling "out of sorts". Discomfort.
 - Increased liver transaminases in your blood, Increased GGT (a liver enzyme called gamma-glutamyltransferase) in your blood, Increased liver enzymes in your blood.
 - Procedural pain.
 - Rare (may affect up to 1 in 1,000 people)
 - Infectior
 - Inappropriate secretion of a hormone that controls urine volume
 - · Sleep walking.
 - Sleep-related eating disorder.
 - Sugar in the urine, Low blood sugar, High blood triglycerides (a
 - · Lack of emotion, Inability to reach orgasm.
 - Not moving or responding while awake (catatonia).
 - · Blood vessel problems in the brain. · Coma due to uncontrolled diabetes.

 - Shaking of the head.
 - · Glaucoma (increased pressure within the eyeball), Problems with movement of your eyes, Eye rolling, Eyelid margin
 - Eye problems during cataract surgery. During cataract surgery, a condition called intraoperative floppy iris syndrome (IFIS) can happen if you take or have taken Risperidone. If you need to have cataract surgery, be sure to tell your eye doctor if you take or have taken this medicine.
 - Dangerously low numbers of a certain type of white blood cell needed to fight infection in your blood.
 - · Dangerously excessive intake of water.
 - Irregular heart beat.
 - Trouble breathing during sleep (sleep apnea), fast, shallow breathing.
 - Inflammation of the pancreas, a blockage in the bowels.
 - · Swollen tongue, Chapped lips, Rash on skin related to drug. Dandruff.

 - Breakdown of muscle fibres and pain in muscles (rhabdomvolvsis)
 - · A delay in menstrual periods, Enlargement of the glands in

your breasts, Breast enlargement, Discharge from the breasts. Increased insulin (a hormone that controls blood sugar levels)

- in your blood.
- Hardening of the skin.
- · Decreased body temperature, Coldness in arms and legs.
- Symptoms of drug withdrawal.
- Yellowing of the skin and the eyes (jaundice).
- Very rare (may affect up to 1 in 10,000 people):
- Life threatening complications of uncontrolled diabetes. Serious allergic reaction with swelling that may involve the throat and lead to difficulty breathing
- · Lack of bowel muscle movement that causes blockage.

The following side effect has been seen with the use of another medicine called paliperidone that is very similar to risperidone, so these can also be expected with Risperidone: Rapid heartbeat upon standing.

Additional side effects in children and adolescents

In general, side effects in children are expected to be similar to those in adults.

The following side effects were reported more often in children and adolescents (5 to 17 years) than in adults: feeling sleepy, or less alert, fatigue (tiredness), headache, increased appetite, vomiting, common cold symptoms, nasal congestion, abdominal pain, dizziness, cough, fever, tremor (shaking), diarrhoea, and incontinence (lack of control) of urine.

Reporting of side effects

If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via Yellow Card Scheme, Website: www.mhra.gov.uk/yellowcard or search for MHRA Yellow Card in the Google Play or Apple App Store. By reporting side effects you can help provide more information on the safety of this medicine.

5. How to store Risperidone

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the packaging after EXP. The expiry date refers to the last day of that month

This medicine does not require any special storage conditions.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. Contents of the pack and other information

What Risperidone contains

- The active substance is risperidone.
- Each orodispersible tablet contains 0.5 mg risperidone. Each orodispersible tablet contains 1 mg risperidone. Each orodispersible tablet contains 2 mg risperidone.
- Other ingredients are mannitol (E421), basic butylated methacrylate copolymer, povidone K-25, microcrystalline cellulose, hydroxypropylcellulose, aspartame (E951), crospovidone, red iron oxide (E172), spearmint flavour, peppermint flavour, calcium silicate, magnesium stearate. See section 2 "Risperidone contains aspartame (E951)".

What Risperidone looks like and contents of the pack Orodispersible tablets are round, slightly convex, pink marbled

Contents of the packs: 20, 28, 30, 50, 56, 60, 98 or 100 tablets in blisters, in a box.

Not all pack sizes may be marketed.
