Amitriptyline Hydrochloride 25mg/5ml Oral Solution

Read all of this leaflet carefully before you start taking this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor or pharmacist.
 - This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. See section 4.

- 1. What Amitriptyline 25mg/5ml Oral Solution is and what it is used for
- 2. What you need to know before you take Amitriptyline 25mg/5ml Oral Solution
- How to take Amitriptyline 25mg/5ml Oral Solution
- 4. Possible side effects
- 5. How to store Amitriptyline 25mg/5ml Oral Solution
- Contents of the pack and other information 1. What Amitriptyline 25mg/5ml Oral Solution is and what it is used for

Amitriptyline belongs to a group of medicines known as tricyclic antidepressants. This medicine is used to treat:

Depression in adults (major depressive episodes)

- Neuropathic pain in adults
- Chronic tension type headache prophylaxis in adults Migraine prophylaxis in adults
- Bed-wetting at night in children aged 6 years and above, only when organic causes, such as spina bifida and related
- disorders, have been excluded and no response has been achieved to all other non-drug and drug treatments, including muscle relaxants and desmopressin. This medicine should only be prescribed by doctors with expertise in treating patients with persistent bed-wetting.

Do not take Amitriptyline: if you are allergic to amitriptyline or any of the other ingredients of this medicine (listed in section 6)

2. What you need to know before you take Amitriptyline 25mg/5ml Oral Solution

- if you recently have had a heart attack (myocardial infarction)
- if you have heart problems such as disturbances in heart rhythm which are seen on an electrocardiogram (ECG), heart block, or coronary artery disease if you are taking medicines known as monoamine oxidase inhibitors (MAOIs)
- if you have taken MAOIs within the last 14 days if you have taken moclobemide the day before
- if you have a severe liver disease.
- If you are treated with amitriptyline, you have to stop taking this medicine and wait for 14 days before you start treatment with a MAOI.

This medicine should not be used for children below 6 years of age. Warnings and precautions - Take special care with Amitriptyline: Serious cutaneous reactions including drug reaction with eosinophilia and systemic symptoms (DRESS) have been

reported in association with Amitriptyline treatment. Stop using Amitriptyline and seek medical attention immediately if

you notice any of the symptoms related to these serious cutaneous reactions described in section 4. Talk to your doctor or pharmacist before taking amitriptyline. Heart rhythm disorders and hypotension may occur if you receive a high dosage of amitriptyline. This might also occur in usual doses if you have pre-existing heart disease.

Prolonged QT interval A heart problem called "prolonged QT interval" (which is shown on your electrocardiogram, ECG) and heart rhythm

have slow heart rate,

have or had a problem where your heart cannot pump the blood round your body as well as it should (a condition called heart failure),

- have a surgery planned as it might be necessary to stop the treatment with amitriptyline before you are given
- are taking any other medication that may cause heart problems, or have a problem that gives you a low level of potassium or magnesium, or a high level of potassium in your blood
- anaesthetics. In the case of acute surgery, the anaesthetist should be informed about the treatment of amitriptyline have an over active thyroid gland or receive thyroid medication.
- The use of Buprenorphine together with Amitriptyline can lead to serotonin syndrome, a potentially life-threatening condition (see "Other medicines and Amitriptyline).

disorders (rapid or irregular heart beat) have been reported with amitriptyline. Tell your doctor if you:

Thoughts of suicide and worsening of your depression If you are depressed, you can sometimes have thoughts of harming or killing yourself. These may be increased when first starting antidepressants, since these medicines all take time to work, usually about two weeks but sometimes longer.

section 2 Other medicines and Amitriptyline and section 3).

You may be more likely to think like this: If you have previously had thoughts about killing or harming yourself. If you are a young adult. Information from clinical trials has shown an increased risk of suicidal behaviour in young adults (less than 25 years old) with psychiatric conditions who were treated with an antidepressant.

If you have thoughts of harming or killing yourself at any time, contact your doctor or go to a hospital straight away.

You may find it helpful to tell a relative or close friend that you are depressed, and ask them to read this leaflet. You might ask them to tell you if they think your depression or anxiety is getting worse, or if they are worried about changes in your behaviour.

Episodes of mania Some patients with manic-depressive illness may enter into a manic phase. This is characterized by profuse and rapidly changing ideas, exaggerated gaiety and excessive physical activity. In such cases, it is important to contact your doctor

who probably will change your medication.

pressure in the eye)

Tell your doctor if you have, or have had in the past, any medical problems, especially if you have: narrow-angle glaucoma (loss of enlarged prostate pylorus stenosis (narrowing of the vision due to abnormally high gastric outlet) and paralytic ileus (blocked intestine) thyroid disease

epilepsy, a history of convulsions diabetes as you might need an schizophrenia severe liver disease adjustment of your antidiabetic difficulty in passing urine severe heart disease

bipolar disorder

medicine. If you use antidepressants such as SSRIs, your doctor might consider changing the dose of your medicine (see also

(see also section 4 Possible side effects). Children and adolescents Depression, neuropathic pain, chronic tension type headache and migraine prophylaxis

Elderly are more likely to suffer from certain side effects, such as dizziness when you stand up due to low blood pressure

Do not give this medicine to children and adolescents aged below 18 years for these treatments as safety and efficacy have not been established in this age group.

Bed-wetting at night

An ECG should be performed prior to initiating therapy with amitriptyline to exclude long QT syndrome This medicine should not be taken at the same time as an anticholinergic drug (see also section 2 Other medicines and

Amitriptyline) Suicidal thoughts and behaviours may also develop during early treatment with antidepressants for disorders other

Other medicines and Amitriptyline Tell your doctor or pharmacist if you are taking or have recently taken any other medicines, such as: monoamine oxidase inhibitors (MAOIs) e.g. phenelzine, iproniazid, isocarboxazid, nialamide or tranylcypromine (used to treat depression) or selegiline (used to treat Parkinson's disease). These should not be taken at the same time as

than depression; the same precautions observed when treating patients with depression should therefore be followed

adrenaline, ephedrine, isoprenaline, noradrenaline, phenylephrine and phenylpropanolamine (these may be present in

when treating patients with enuresis.

cough or cold medicine, and in some anaesthetics) medicine to treat high blood pressure for example calcium-channel blockers (e.g. diltiazem and verapamil),

medicines to treat fungal infections (e.g. fluconazole, terbinafine, ketoconazole, and itraconazole)

guanethidine, betanidine, clonidine reserpine and methyldopa Anticholinergic drugs such as certain medicines to treat Parkinson's disease and gastrointestinal disorders (e.g. atropine, hyoscyamine) thioridazine (used to treat schizophrenia) tramadol (painkiller)

sedatives (e.g. barbiturates) buprenorphine/opioids (methadone, naloxone). These medicines may interact with amitriptyline and you may experience symptoms such as involuntary, rhythmic contractions of muscles, including the muscles that control movement of the eye, agitation, hallucinations, coma, excessive sweating, tremor, exaggeration of reflexes, increased muscle tension, body temperature above 38°C. Contact your doctor when experiencing such symptoms.

amitriptyline (see section 2 Do not take amitriptyline)

antidepressants (e.g SSRIs (fluoxetine, paroxetine, fluvoxamine), duloxetine and bupropion) medicines for certain heart conditions (e.g. beta blockers and antiarrhythmics) cimetidine (used to treat stomach ulcers) methylphenidate (used to treat ADHD)

ritonavir (used to treat HIV) oral contraceptives

rifampicin (to treat infections)

halofantrine (used to treat malaria) diuretics ("water tablets" e.g. furosemide).

phenytoin and carbamazepine (used to treat epilepsy) St. John's Wort (Hypericum perforatum, a herbal remedy used among others for depression) as it may increase the metabolism of amitriptyline, resulting in lower plasma levels of amitriptyline and reduced antidepressant response

cisapride (used to treat certain types of indigestion)

You should also tell your doctor if you take or have recently taken medicine that may affect the heart's rhythm. e.g.: medicines to treat irregular heartbeats (e.g. quinidine and sotalol) astemizole and terfenadine (used to treat allergies and hayfever)

If you are going to have an operation and receive general or local anaesthetics, you should tell your doctor that you are taking this medicine. Likewise, you should tell your dentist that you take this medicine if you are to receive a local anaesthetic.

thyroid medication valproic acid.

Amitriptyline with alcohol It is not advised to drink alcohol during treatment with this medicine as it might increase the sedative effect. Pregnancy and breast-feeding

medicines used to treat some mental illnesses (e.g. pimozide and sertindole)

If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor for advice before taking this medicine. Amitriptyline is not recommended during pregnancy unless your doctor considers it clearly necessary and only after

the benefit of breast-feeding for your child and the benefit of therapy for you.

newborn may have withdrawal symptoms such as irritability, increased muscle tension, tremor, irregular breathing, poor drinking, loud crying, urinary retention, and constipation. Your doctor will advise you whether to start/continue/ stop breast-feeding, or stop using this medicine taking into account

Driving and using machines This medicine may cause drowsiness and dizziness, especially in the beginning of the treatment. Do not drive or work with tools or machinery if you are affected. Amitriptyline 25mg/5ml Oral Solution contains methyl parahydroxybenzoate, propyl parahydroxybenzoate, propylene glycol, liquid maltitol, ethanol and E122:

methyl (E218) and propyl parahydroxybenzoates (E216). These may cause an allergic reaction (possibly delayed).

careful consideration of the benefit and risk. If you have taken this medicine during the last part of the pregnancy, the

propylene glycol (E1520). This medicine contains 104.6mg propylene glycol in each 5ml dose. liquid maltitol (E965). If you have been told by your doctor that you have an intolerance to some sugars, contact your doctor before taking this medicinal product. This may have a mild laxative effect and has a calorific value 2.3kcal/g.

or 1ml wine. The small amounts of alcohol in this medicine will not have any noticeable effects. a colouring agent E122. This may cause allergic reactions.

Always take this medicine exactly as your doctor has told you. Check with your doctor if you are not sure. Not all dosage schemes can be achieved with all the pharmaceutical forms/strengths. The appropriate formulation/ strength should be selected for the starting doses and any subsequent dose increases.

ethanol. This medicine contains 0.11mg of alcohol (ethanol) in each 5ml dose which is equivalent to less than 1ml beer

The recommended daily dose is 25 mg - 75 mg.

The recommended initial dose is 10 mg - 25 mg in the

Depending on your response to the medicine, your doctor may gradually increase the dose. If you receive doses above 100 mg daily, your doctor may need to do more frequent follow-up with you. Your doctor will instruct you whether to take the doses once daily or divide into two doses.

Elderly (above 65 years of age) and patients with cardiovascular disease The recommended initial dose is 10 mg - 25 mg in the evening. Depending on your response to the medicine, your doctor may gradually increase the dose. If you receive doses above 75

mg daily, your doctor may need to do more frequent follow-up with you. Use in children and adolescents This medicine should not be given to children or adolescents for treatments of neuropathic pain, chronic tension type

Bed-wetting at night Use in children and adolescents The recommended doses for children: aged below 6 years: see section 2 Do not take Amitriptyline aged 6 to 10 years: 10 mg $\,$ - 20 mg daily. A suitable dosage form should be used for this age group.

headache prophylaxis and migraine prophylaxis. For further information please see section 2.

aged 11 years and above: 25 mg - 50 mg. The dose should be increased gradually. Take this medicine 1-1½ hours before bedtime.

Before starting treatment, your doctor will conduct an ECG of your heart to check for sign of unusual heartbeat. Your doctor will re-evaluate your treatment after 3 months and if needed perform a new ECG.

Do not stop the treatment without consulting your doctor first. Patients with special risks

Your doctor may take blood samples to determine the level of amitriptyline in the blood (see also section 2).

Patients with liver diseases or people known as "poor metabolisers" usually receive lower doses.

decided by your doctor.

Bed-wetting at night

fever

This medicine can be taken with or without food. **Duration of treatment**

Do not change the dose of the medicine or stop taking the medicine without consulting your doctor first. Depression As with other medicines for the treatment of depression it may take a few weeks before you feel any improvement.

In treating depression the duration of treatment is individual, and is usually at least 6 months. The duration of treatment is

Continue to take this medicine for as long as your doctor recommends. The underlying illness may persist for a long time. If you stop your treatment too soon, your symptoms may return. Neuropathic pain, chronic tension type headache and migraine prophylaxis

It might take a few weeks before your feel any improvement of your pain. Talk to your doctor about the duration of your treatment and continue to take this medicine for as long as your doctor recommends.

If you take more Amitriptyline Oral Solution than you should Contact your doctor or nearest hospital casualty department immediately. Do this even if there are no signs of discomfort

How and when to take Amitriptyline Oral Solution

Symptoms of overdose include: dilated pupils confusion

or poisoning. Take the container of this medicine with you if you go to a doctor or hospital.

Your doctor will evaluate if the treatment should be continued after 3 months.
