Clomipramine may cause dryness of the mouth. If this continues or becomes troublesome, tell your doctor, so the dose of the medicine can be reduced or stopped. Reduce your intake of fluids if you also have a dry nose or throat.

Clomipramine may need to be reduced or stopped before certain medical operations (including dental procedures), as the dose of the medicine can affect the results of any tests used to monitor your health.

If you have been told by your doctor that you have or may have had a temperature in excess of 38°C (100°F), you may experience exaggerated reflexes, increased muscle contractions of muscles, including the muscles of the face, eye, throat, stomach, intestine and blood vessels. The temperature will probably be brought down by lowering the amount of medicine you are taking. This may require the administration of intravenous fluids, sedation or artificial ventilation. It may also be necessary to stop the medicine temporarily. You will be given the exact dose of the medicine that is suitable for you. This is normally 30 - 150 mg daily or up to a maximum of 250 mg daily for severe conditions. If you have any problems with the dose of the medicine you are taking, speak to your doctor as soon as possible. People with epilepsy, who take anticonvulsants to prevent fits, may experience more fits while taking Clomipramine or may experience fits of a different type. You should carry an identification card or carry a note of your medication and dose as a precaution. Do not drive while taking this medicine until you have found out whether it is safe for you to drive.

If you feel dizzy, tired, have blurred vision, have problems with your speech or have problems with your balance, tell your doctor or pharmacist as soon as possible.

Clomipramine is used to treat depression which is usually accompanied by an increase in the activity of the nerves which control emotions. Cataplexy often affects people who have narcolepsy (a sleep disorder). Cataplexy is a disorder which causes attacks of sudden loss of muscle tone which can result in collapse. The attacks are triggered by strong emotions or feelings. If you have attacks of cataplexy, tell your doctor. The attacks are more likely to happen at the beginning of treatment, during periods of stress or when you start taking a higher dose of the medicine. The attacks may continue throughout treatment. The dose of the medicine can be increased to a maximum of 75 mg daily. For obsessions and phobias

If you are pregnant or breast-feeding, think you may be pregnant, or are planning to have a baby, do not take Clomipramine without first talking to your doctor or pharmacist. Clomipramine can lead to serotonin syndrome, a potentially life-threatening condition (see "Other medicines and Clomipramine"). Other medicines and Clomipramine

Some side effects can be serious

- If you stop taking Clomipramine suddenly, or if you take more Clomipramine than you should, you may get these side effects:
  - amnesia, loss of memory
  - confusion
  - hallucinations
  - aggression
  - convulsions
  - coma (unconscious)

- If you take more Clomipramine than you should, you should contact your doctor or go to A&E immediately.

- Your heart and nervous system will be affected.

- If you take less Clomipramine than you should, you may get these side effects:
  - tiredness
  - feeling sick, nausea
  - loss of appetite

- If you take less Clomipramine than you should, you should contact your doctor or go to A&E immediately.

- Your heart and nervous system will be affected.

- If you take Clomipramine in the same way as you should, you may get these side effects:
  - hypothermia (very low body temperature)
  - hypotension (a drop in blood pressure)
  - hypertension (increased blood pressure)

- If you take Clomipramine in the same way as you should, you should contact your doctor or go to A&E immediately.

- Your heart and nervous system will be affected.

- If you take more Clomipramine than you should, you may get these side effects:
  - anaphylactic shock
  - allergic shock

- If you take more Clomipramine than you should, you should contact your doctor or go to A&E immediately.

- Your heart and nervous system will be affected.

- If you take less Clomipramine than you should, you may get these side effects:
  - hypotension (a drop in blood pressure)
  - hypertension (increased blood pressure)

- If you take fewer Clomipramine than you should, you should contact your doctor or go to A&E immediately.

- Your heart and nervous system will be affected.

- If you take more Clomipramine than you should, you may get these side effects:
  - amnesia, loss of memory
  - confusion
  - hallucinations
  - aggression
  - convulsions
  - coma (unconscious)

- If you take more Clomipramine than you should, you should contact your doctor or go to A&E immediately.
