In every 10,000 women who take the Pill for up to 5 years but cancers diagnosed is higher if the age until which the woman gets older. Therefore, the extra number of breast decreases, so that 10 years after stopping the Pill the risk is the same as for women who have never taken the Pill. Breast take the Pill. If women stop taking the Pill, the risk gradually breast-feeding. A disadvantage is that vaginal bleeding may occur at irregular intervals during the Use of Cerelle. Also, women who do not tolerate oestrogens and by women who are older. Therefore, the extra number of breast-cancers found in women who take the Pill, seem less likely to have spread than breast cancers found in women who use the same contraceptives. If women stop taking the Pill by the age of 20, there would be less than 1 case of breast-cancer per 100,000 women. If women stop taking the Pill by the age of 40, there would be 20 extra cases in this age group. If any of these conditions appears for the first time while using Cerelle, your doctor may advise you to use a different method of birth-control.

The risk of breast cancer in users of progestogen-only pills like Cerelle is believed to be similar to that in women who use the Pill, but the evidence is less conclusive.

If you are breast-feeding and want to use Cerelle, please tell your doctor. Your doctor can explain to you what to do.

If you have an unexplained vaginal bleeding.

• If you are allergic to desogestrel or any of the other medicines used for the treatment of:

• If you are taking medicines or herbal products that might make Cerelle less effective, a barrier contraceptive method should also be used. Your doctor can tell you if you need to take additional contraceptive precautions (see section 6.2). If you are allergic to desogestrel, Cerelle may be used while you are breast-feeding. Cerelle does not affect the breasts.
You can stop taking Cerelle whenever you want. From the day
