Phenytoin Injection is used to:
- prevent and treat fits recurring frequently
- control epileptic fits involving jerking and spasm of the muscles (known as grand mal fits)
- control the overactivity in the brain that can cause epilepsy or seizures (fits).

Each medicine is unique in that it can affect the way other medicines work or is affected by other medicines.

Some medicines can affect the way Phenytoin Injection works or Phenytoin Injection itself can affect the way other medicines work.

This will allow your doctor to decide whether it is safe for you to be given phenytoin.

You should not be given phenytoin if:
- you are allergic to other hydantoins
- you have recently taken Phenytoin Injection or phenytoin products
- you have taken another anticonvulsant that has stopped working
- you have had a serious skin reaction to any other medicine

Phenytoin belongs to a group of drugs known as hydantoins. It is called an anticonvulsant because it works by controlling the overactivity in the brain that can cause epilepsy or seizures (fits).
