Package leaflet: Information for the user

XEOMIN 50 units powder for solution for injection
XEOMIN 100 units powder for solution for injection
XEOMIN 200 units powder for solution for injection

Clostridium Botulinum neurotoxin type A (150 kD), free from complexing proteins

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor, pharmacist, or nurse.
- If you get any side effects, talk to your doctor, pharmacist, or nurse. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet:
1. What XEOMIN is and what it is used for
2. What you need to know before XEOMIN is used
3. How to use XEOMIN
4. Possible side effects
5. How to store XEOMIN
6. Contents of the pack and other information

1. What XEOMIN is and what it is used for

XEOMIN is a medicine that relaxes the muscles.

XEOMIN is used for the treatment of the following conditions in adults:
- eyelid spasm (blepharospasm)
- twisted neck (spasmodic torticollis)
- increased muscle tension/uncontrollable muscle stiffness in shoulders, arms or hands (spasticity of the upper limb)

2. What you need to know before XEOMIN is used

Do not use XEOMIN
- if you are allergic to Botulinum neurotoxin type A or any of the other ingredients of this medicine (listed in section 6)
- if you suffer from a generalised disorder of muscle activity (e.g. myasthenia gravis, Lambert-Eaton syndrome)
- if you have an infection or inflammation at the proposed injection site.

Warnings and precautions
Side effects may occur from misplaced injections of Botulinum neurotoxin type A temporarily paralysing nearby muscle groups. There have been very rare reports of side effects that may be related to the spread of toxin distant from the injection site to produce symptoms consistent to Botulinum toxin type A effects (e.g. excessive muscle weakness, swallowing difficulties or accidental swallowing of food or drink into the airways). Patients who receive the recommended doses may experience excessive muscle weakness.

If the dose is too high or the injections too frequent, the risk of antibody formation may increase. Antibody formation can cause treatment with Botulinum toxin type A to fail, whatever the reason for its use.
Talk to your doctor or pharmacist before XEOMIN is used:
- if you suffer from any type of bleeding disorder
- if you receive substances that prevent the blood from clotting (e.g. coumarin, heparin, acetylsalicylic acid, clopidogrel)
- if you suffer from pronounced weakness or decreased muscle volume in the muscle where you will receive the injection
- if you suffer from amyotrophic lateral sclerosis (ALS), which can lead to generalised muscle decrease
- if you suffer from any disease that disturbs the interaction between nerves and skeletal muscles (peripheral neuromuscular dysfunction)
- if you have or have had swallowing difficulties
- if you suffer or have suffered from seizures
- if you have had problems with injections of Botulinum toxin type A in the past
- if you are due to have surgery

Contact your doctor and seek medical attention immediately if you experience any of the following:
- difficulty in breathing, swallowing or speaking
- hives, swelling including swelling of the face or throat, wheezing, feeling faint and shortness of breath (possible symptoms of severe allergic reactions)

Repeated injections with XEOMIN
If you have repeated injections with XEOMIN, the effect may increase or decrease. Possible reasons for this are:
- your doctor may follow a different procedure when preparing the solution for injection
- different treatment intervals
- injections into another muscle
- marginally varying effectiveness of the active substance of XEOMIN
- non-response/therapy failure during the course of treatment

If you have been inactive for a long period of time, any activity should be started gradually after the XEOMIN injection.

Eyelid spasm (blepharospasm)
Talk to your doctor before XEOMIN is used, if you:
- have had an eye surgery. Your doctor will then take additional precautions.
- are at risk of developing a disease called narrow angle glaucoma. This disease can cause the inner eye pressure to rise and may lead to a damaging of your optic nerve. Your doctor will know if you are at risk.

During treatment, small punctuated bleedings may occur in the soft tissues of the eyelid. Your doctor can limit these by immediately applying gentle pressure at the injection site.

After you receive a XEOMIN injection into your eye muscle your blinking rate may be reduced. This can lead to a prolonged exposure of the transparent front part of the eye (cornea). This exposure may lead to a damaging of the surface and an inflammation (corneal ulceration).

Twisted neck (spasmodic torticollis)
After the injection you may develop mild to severe swallowing difficulties. This may lead to problems with breathing and you may have a higher risk of inhaling foreign substances or fluids. Foreign substances in your lungs may lead to an inflammation or infection (pneumonia). Your doctor will give you special medical treatment if needed (e.g. in the form of artificial nutrition).

Swallowing difficulties can last for up to two to three weeks after injection, for one patient a duration of up to five months is known.
**Increased muscle tension/uncontrollable muscle stiffness in shoulders, arms or hands (spasticity of the upper limb)**

XEOMIN can be used to treat increased muscle tension/uncontrollable muscle stiffness in parts of your upper limb, e.g. your shoulder, elbow, forearm or hand. XEOMIN is effective in combination with the usual standard treatment methods. XEOMIN should be used together with these other methods. It is unlikely that this medicine will improve the range of motion of joints where the surrounding muscle has lost its ability to stretch.

**Children and adolescents**

Do not give this medicine to children and adolescents between the ages of 0-17 years because the use of XEOMIN in children and adolescents has not yet been investigated and is therefore not recommended.

**Other medicines and XEOMIN**

Tell your doctor or pharmacist if you are taking, have recently taken or might take any other medicines.

The effect of XEOMIN may be increased by:
- medicines used to treat certain infectious diseases (spectinomycin or aminoglycoside antibiotics [e.g. neomycin, kanamycin, tobramycin])
- other medicines that relax the muscles (e.g. muscle relaxants of the tubocurarine-type). Such medicines are used, for example, in general anaesthesia. Before you have surgery, tell your anaesthetist if you have received XEOMIN.

In these cases, XEOMIN must be used carefully.

The effect of XEOMIN may be reduced by certain medicines for malaria and rheumatism (known as aminoquinolines).

**Pregnancy, breast-feeding and fertility**

If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor or pharmacist for advice before this medicine is administered.

XEOMIN should not be used during pregnancy, unless your doctor decides that the necessity and potential benefit of the treatment justifies the possible risk on the foetus.

XEOMIN is not recommended if you are breast-feeding.

**Driving and using machines**

You should not drive or engage in other potentially hazardous activities if drooping eyelids, weakness (asthenia), muscle weakness, dizziness or vision disorders occur.

If in doubt ask your doctor for advice.

3. **How to use XEOMIN**

XEOMIN may only be administered by doctors with appropriate specialist knowledge of treatment with Botulinum neurotoxin type A.

The optimum dose, frequency and number of injection sites in the treated muscle will be chosen by your doctor individually for you. The results of initial treatment with XEOMIN should be evaluated and may lead to dose adjustment until the desired therapeutic effect is achieved.

If you have the impression that the effect of XEOMIN is too strong or too weak, let your doctor know. In cases where no therapeutic effect is apparent, alternative therapies should be taken into consideration.
**Eyelid spasm** (blepharospasm)

The recommended dose is up to 25 units per eye, and the total recommended dose in follow-up treatment sessions is up to 100 units per session. Usually, the first onset of effect is observed within four days after injection. The effect of each treatment generally lasts for about 3-4 months, however, it may last significantly longer or shorter. The treatment can be repeated if required. Treatment intervals will be determined by your doctor based on your actual need.

Normally, no additional benefit is conferred by treating more frequently than every three months.

**Twisted neck** (spasmodic torticollis)

The recommended dose per single injection site is up to 50 units, and the maximum dose for the first treatment session is 200 units. Doses up to 300 units may be given by your doctor in subsequent courses depending on the response. Usually, the first onset of effect is observed within seven days after injection. The effect of each treatment generally lasts for about 3-4 months, however, it may last significantly longer or shorter. Treatment intervals of less than 10 weeks are not recommended. Treatment intervals will be determined by your doctor based on your actual need.

**Increased muscle tension/uncontrollable muscle stiffness in shoulders, arms or hands** (spasticity of the upper limb)

The recommended dose is up to 500 units per treatment session and no more than 250 units should be administered to the shoulder muscles. Patients reported the onset of action 4 days after treatment. An improvement of muscle tone was perceived within 4 weeks. In general, the treatment effect lasted 12 weeks; however, it may last significantly longer or shorter. The period between each treatment session should be at least 12 weeks. Treatment intervals will be determined by your doctor based on your actual need.

**Method of administration**

Dissolved XEOMIN is intended for injections into the muscle (intramuscular use; see information for healthcare professionals at the end of this leaflet).

**If you are given more XEOMIN than you require**

**Symptoms of overdose:**

Symptoms of overdose are not apparent immediately after the injection and may include general weakness, drooping eyelid, double vision, breathing difficulties, speech difficulties, and paralysis of the respiratory muscles or swallowing difficulties which may result in pneumonia.

**Measures in cases of overdose:**

In case you feel symptoms of overdose please seek medical emergency services immediately or ask your relatives to do so, and have yourself admitted to hospital. Medical supervision for up to several days and assisted ventilation may be necessary.

If you have any further questions on the use of this medicine, ask your doctor, pharmacist or nurse.

**4. Possible side effects**

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Usually, side effects are observed within the first week after treatment and are temporary in nature. Side effects may be related to the medicine, injection technique or both. Side effects may be restricted to the area around the injection site (e.g. localised muscle weakness, local pain, inflammation, pins and needles (paraesthesia), reduced sense of touch (hypoesthesia), tenderness, swelling (general), swelling of the soft tissue (oedema), skin redness (erythema), itching, localised infection, haematoma, bleeding and/or bruising).

The injection of the needle may cause pain. This pain or the anxiety towards needles may lead to fainting, nausea, tinnitus (ringing in the ears) or a low blood pressure.
Side effects such as excessive muscle weakness or swallowing difficulties may be caused by the relaxation of muscles far from the injection site of XEOMIN. Swallowing difficulties can cause inhalation of foreign bodies resulting in lung inflammation and in some cases, death.

An allergic reaction may occur with XEOMIN. Serious and/or immediate allergic reactions (anaphylaxis) or allergic reactions to the serum in the product (serum sickness), causing for example difficulty in breathing (dyspnoea), hives (urticaria) or swelling of the soft tissue (oedema), have been rarely reported. Some of these reactions have been observed following the use of conventional Botulinum toxin type A complex. They occurred when the toxin was given alone or in combination with other products known to cause similar reactions. An allergic reaction can cause any of the following symptoms:
- difficulty with breathing, swallowing or speaking due to the swelling of the face, lips, mouth or throat
- swelling of the hands, feet or ankles.

If you notice any of these side effects, please inform your doctor immediately or ask your relatives to do so and go to the accident and emergency department of your nearest hospital.

**Eyelid spasm (blepharospasm)**
The following side effects have been observed with XEOMIN:

*Very common (may affect more than 1 in 10 people):*
- Drooping eyelid (ptosis), dry eyes

*Common (may affect up to 1 in 10 people):*
- Vision blurred, visual impairment, double vision (diplopia), lacrimation increased, dry mouth, swallowing difficulties (dysphagia), headache, injection site pain, fatigue, muscular weakness, weakness of face muscle (facial paresis)

*Uncommon (may affect up to 1 in 100 people):*
- Rash

**Twisted neck (spasmodic torticollis)**
The following side effects have been observed with XEOMIN:

*Very common (may affect more than 1 in 10 people):*
- Swallowing difficulties (dysphagia)

*Common (may affect up to 1 in 10 people):*
- Neck pain, muscular weakness, musculoskeletal pain (myalgia), musculoskeletal stiffness, muscle spasms, headache, dizziness, injection site pain, weakness (asthenia), dry mouth, nausea, sweating increased (hyperhidrosis), upper respiratory tract infection, feeling faint (presyncope)

*Uncommon (may affect up to 1 in 100 people):*
- Speech disorders (dysphonia), shortness of breath (dyspnoea), rash

The treatment of twisted neck may cause swallowing difficulties with varying degrees of severity. This may lead to breathing in foreign materials, which may require medical intervention. Swallowing difficulties may persist for two to three weeks after injection, but has been reported in one case to last five months. Swallowing difficulties appear to be dose-dependent.

**Increased muscle tension/uncontrollable muscle stiffness in shoulders, arms or hands (spasticity of the upper limb)**
The following side effects have been observed with XEOMIN:
Common (may affect up to 1 in 10 people):
Dry mouth

Uncommon (may affect up to 1 in 100 people):
Headache, reduced sense of touch (hypoesthesia), muscular weakness, pain in extremity, weakness (asthenia), musculoskeletal pain (myalgia), swallowing difficulties (dysphagia), nausea

Not known (cannot be estimated from the available data):
Injection site pain

Some of these side effects may be disease related.

Post-marketing experience
There have been reports of flu-like symptoms and hypersensitivity reactions, such as swelling of the soft tissue (oedema, also distant from the injection site), redness, itching, rash (local and generalised) and breathlessness.

Reporting of side effects
If you get any side effects, talk to your doctor, pharmacist or nurse. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via the Yellow Card Scheme at [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard) (UK) or via HPRA Pharmacovigilance, Earlsfort Terrace, IRL - Dublin 2, Tel: +353 1 6764971, Fax: +353 1 6762517, Website: [www.hpra.ie](http://www.hpra.ie), e-mail: medsafe@hpra.ie (IE). By reporting side effects, you can help provide more information on the safety of this medicine.

5. **How to store XEOMIN**

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the carton and vial label after “EXP”. The expiry date refers to the last day of that month.

Unopened vial: Do not store above 25 °C.
Reconstituted solution: Chemical and physical in-use stability has been demonstrated for 24 hours at 2 °C to 8 °C.
From a microbiological point of view, the product should be used immediately. If not used immediately, in-use storage times and conditions prior to use are the responsibility of the user and would normally not be longer than 24 hours at 2 °C to 8 °C, unless reconstitution has taken place in controlled and validated aseptic conditions.

Your doctor should not use XEOMIN if the solution has a cloudy appearance or contains visible particles.

Do not throw away any medicines via wastewater.
For instructions on disposal, please see information for healthcare professionals at the end of this leaflet.

6. **Contents of the pack and other information**

**What XEOMIN contains**
- The active substance is: Clostridium Botulinum neurotoxin type A (150 kD), free from complexing proteins.
  One vial contains 50, 100 or 200 units Clostridium Botulinum neurotoxin type A (150 kD), free from complexing proteins.
- The other ingredients are: human albumin, sucrose.
What XEOMIN looks like and contents of the pack

XEOMIN is presented as a powder for solution for injection. The powder is white. Dissolving the powder produces a clear, colourless solution.

XEOMIN 50 units powder for solution for injection: Pack sizes of 1, 2, 3 or 6 vials
XEOMIN 100 units powder for solution for injection: Pack sizes of 1, 2, 3, 4 or 6 vials
XEOMIN 200 units powder for solution for injection: Pack sizes of 1, 2, 3, 4 or 6 vials

Not all pack sizes may be marketed.

XEOMEEN: Belgium

This leaflet was last revised in 02/2018.

The following information is intended for healthcare professionals only:

Instructions for reconstitution of the solution for injection:

XEOMIN is reconstituted prior to use with sodium chloride 9 mg/ml (0.9 %) solution for injection.

XEOMIN may only be applied for its intended use to treat one patient for one session.

It is good practice to reconstitute the vial contents and prepare the syringe over plastic-lined paper towels to catch any spillage. An appropriate amount of sodium chloride solution (see dilution table) is drawn up into a syringe. A 20-27 G short bevel needle is recommended for reconstitution. After vertical insertion of the needle through the rubber stopper, the solvent is injected gently into the vial in order to avoid foam formation. The vial must be discarded if the vacuum does not pull the solvent into the vial. Remove the syringe from the vial and mix XEOMIN with the solvent by carefully swirling and inverting/flipping...
the vial – do not shake vigorously. If needed, the needle used for reconstitution should remain in the vial and the required amount of solution should be drawn up with a new sterile syringe suitable for injection.

Reconstituted XEOMIN is a clear, colourless solution.

XEOMIN must not be used if the reconstituted solution (prepared as above) has a cloudy appearance or contains floccular or particulate matter.

Care should be taken to use the correct diluent volume for the presentation chosen to prevent accidental overdose. If different vial sizes of XEOMIN are being used as part of one injection procedure, care should be taken to use the correct amount of diluent when reconstituting a particular number of units per 0.1 ml. The amount of diluent varies between XEOMIN 50 units, XEOMIN 100 units and XEOMIN 200 units. Each syringe should be labelled accordingly.

Possible dilutions for XEOMIN 50, 100 and 200 units are indicated in the following table:

<table>

**Instructions for disposal**

Any solution for injection that has been stored for more than 24 hours as well as any unused solution for injection should be discarded.

**Procedure to follow for a safe disposal of vials, syringes and materials used**

Any unused vials or remaining solution in the vial and/or syringes should be autoclaved. Alternatively, the remaining XEOMIN can be inactivated by adding one of the following solutions: 70 % ethanol, 50 % isopropanol, 0.1 % SDS (anionic detergent), diluted sodium hydroxide solution (0.1 N NaOH), or diluted sodium hypochlorite solution (at least 0.1 % NaOCl).

After inactivation used vials, syringes and materials should not be emptied and must be discarded into appropriate containers and disposed of in accordance with local requirements.
Recommendations should any incident occur during the handling of Botulinum toxin type A

- Any spills of the product must be wiped up: either using absorbent material impregnated with any of the above solutions in case of the powder, or with dry, absorbent material in case of reconstituted product.
- The contaminated surfaces should be cleaned using absorbent material impregnated with any of the above solutions, then dried.
- If a vial is broken, proceed as mentioned above by carefully collecting the pieces of broken glass and wiping up the product, avoiding any cuts to the skin.
- If the product comes into contact with skin, rinse the affected area abundantly with water.
- If product gets into the eyes, rinse thoroughly with plenty of water or with an ophthalmic eyewash solution.
- If product comes into contact with a wound, cut or broken skin, rinse thoroughly with plenty of water and take the appropriate medical steps according to the dose injected.

These instructions for use, handling and disposal should be strictly followed.
